

Nocturnal Animals

Nocturnal animals are ones that are awake during the night and asleep during the day. You might think that's a little silly – can you imagine getting up in the dark to play with your friends and eat your dinner? But that is how nocturnal animals live. Read on to find out more about these fascinating beasts.

Fox

Foxes can live in forests, cities or even in the snow (those foxes are called Arctic' foxes). They eat small mammals, as well as fruit, and they have whiskers all over their body – not just on their face!

Badgers

Badgers live underground in a home called a sett', but they come out as soon as it is dark to look for food. They can't see very well, but they are good at smelling.

Hedgehog

Hedgehogs are prickly creatures! They have between 5000 and 7000 spines, which are made of the same material as our fingernails.

Bats

Did you know that bats are the only mammals that can fly? There are over 1000 types of bat, including the fruit bat, the micro bat and the blood-sucking vampire bat!

Questions

1. What does 'nocturnal' mean?

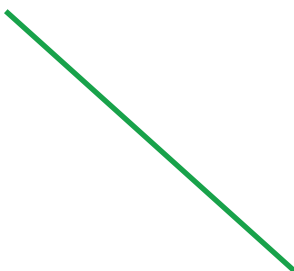

2. Look at the section about foxes.

Which of the following statements are true? Tick the correct statements.

- ☐ Foxes have whiskers all over their body.
- ☐ Foxes live in the sea.
- ☐ Foxes make good pets.
